WIRELESS NAVIGATIONAL SYSTEM, DEVICE AND METHOD

ABSTRACT

A system comprises at least one positioning support device and a personal portable wireless user device. The positioning support device is operable to be placed near a navigation feature and to communicate appropriate navigational information, including absolute position and relative position with respect to a navigational feature. A user device is operable to receive the navigational information and communicate it to a user. A method operates to permit users to independently navigate local, overland or underwater areas and is especially useful for persons who whose vision may be impaired.
